📍 Gdańsk, Polska

SKILLS

- JavaScript, TypeScript
- React, NextJS, Vite, Nx
- React Query, Redux, RTK Query, MobX, Zustand
- HTML, CSS/SCSS
- Git, Webpack, husky, pnpm, Docker, CI/CD, AWS
- Jest, React Testing Library, Playwright
- Shadcn, Chakra UI, Tailwind
- NodeJS, NestJS, REST API, JWT, PostgreSQL, MongoDB, MySQL
- Teamwork, Communication

LANGUAGES

- English (B2)
- Polish (C1)

EDUCATION

University of Gdańsk

Computer Science – part-time
2025 - present

District School Complex No. 2 in Kościerzyna

IT Technician
2022 - 2025

CERTIFICATES

INF.02 - 91%

INF.03 - 91%

Vocational Diploma – IT Technician (94%)

SUMMARY

Frontend Developer with 4 years of practical experience, which I started before turning 18 by building my own projects and selling them to clients. I have commercial experience with React, Next.js, and TypeScript, have written tests in Jest and Playwright, and possess basic backend knowledge in PHP and Node.js. I enjoy working independently and like having the opportunity to create solutions from start to finish. Frontend suits me particularly well because I can see the results of my work immediately after each change. I am looking for a role where frontend work is not just clicking in Figma, but real product development with a tangible impact on how it works.

EXPERIENCE

REACT DEVELOPER

2024-2025

WinWinTravel

- I implemented Optimistic Updates using React Query, which made the interface respond almost instantly instead of waiting for the server (~800ms). I measured this improvement with Web Vitals and user feedback. If something went wrong, the UI would automatically revert to the previous state.
- I started writing tests with Jest and Playwright in a project that previously had none. I approached it using TDD – writing tests first, then code. This led me to refactor many components from scratch, increasing code coverage to around 40% in key areas. As a result, bugs that previously appeared with every optimization stopped recurring. The team noted that the code became significantly easier to read and maintain.
- I improved the Lighthouse score from around 60 to 90, a 35% increase. To achieve this, I implemented lazy loading of images, code splitting, and optimized component rendering. The site started loading noticeably faster, especially on pages with hotel and tour listings.

FULL STACK WEB DEVELOPER & PRODUCT OWNER

2019-2022

- I built a CRM system from scratch for managing payments and donations, which I deployed on my own project and sold as a module to other servers. Over time, around 70 clients used my services, generating a total revenue of approximately 15,000–20,000 PLN.
- In addition to my own project, I took on orders from other server owners, implementing ready-made payment modules for them. Larger projects generated 2,000–3,000 PLN per month, which at the time was a significant revenue in the Eastern European market. This experience taught me how to work with client requirements, deliver functioning code on time, and support a product after deployment.
- On the backend, I worked with PHP, building custom payment modules and integrations with external payment gateways. This was my first exposure to backend architecture, business logic, and transaction security.
